# ABSTRACT OF THE DISCLOSURE

Methods and systems for enabling a user to create a user-defined map of an Internet document to control how text and links of the Internet document are presented to the user. A user selects and names regions of text or links of an Internet document to create a user-defined map. A user accesses a voice browser which provides an audio representation of the Internet document based on the user-defined map. Prompts assist a user in creating and navigating through the user-defined map. User requests cause an audio representation of the text or links associated with the user-defined map to be played to the user. When selected content associated with the user-defined map is modified then the updated content is provided to the user.
